

Bogdan Kachatov

Senior Product Designer

Portfolio

7+ years of experience designing complex B2B and B2C products. I run design independently, from research to solution testing. I work closely with PMs, developers, analysts, QA engineers and stakeholders: clarifying requirements and constraints, working through user flows and preparing solutions for development. I use AI tools at every stage of my work, from research to implementing components in code.

Work experience

Senior Product Designer | Project-based work

March 2026 - Present | Independent practice

- Designed a service for configuring and enforcing rules for AI agents. Rules can be set for a specific agent, system or action. For sensitive requests, users can set limits and assign a team to review them. The service checks actions while tasks are running. When a review is needed, the reviewer sees the request, the rule that triggered and the context of its execution.

Senior Product Designer | Cellframe

May 2022 - February 2026

Cellframe builds Layer-0 blockchain infrastructure. Responsible for the design of all company products: wallets, DEX trading, staking, VPN, blockchain explorer, e-commerce and internal services. Led design from discovery to launch.

Key achievements

- Led the full design cycle of a fixed-term staking platform, from research to launch. During research, conducted 8 interviews with token holders with different levels of trading experience. Designed the full staking flow: expected reward calculation, term comparison, portfolio screen, and the token unlock and reward claim flow. After launch, only 37% of users enabled auto-reinvestment. The goal of the next iteration was to increase this metric, as it directly affected business revenue. After a second round of interviews and a survey in the community Telegram group, formulated the key hypotheses and redesigned the interface.
- Result: the share of users with auto-reinvestment enabled grew from 37% to 53.3% (+44%). By the end of the program, tokens worth over \$600K were staked.

Skills

Design expertise
End-to-end product design | Interaction design | Information architecture | Design systems | Design guidelines (HIG, Material Design)

Product research
User interviews | Usability testing | CJM | JTBD | Hypothesis validation | A/B testing | Data-driven design

AI in the design process
LLM-assisted research | production-grade functional prototypes | Figma MCP

Tools
Figma | Jitter (Certified expert) | Claude Code | Codex | Pencil | Paper

Product approach
Collaboration with product managers, developers, analysts, and stakeholders | Product decisions informed by unit economics and the Theory of Constraints.

- Designed Cellframe Dashboard, the desktop application of the Cellframe ecosystem: wallet creation, token swaps, transaction history, a console for interacting with the blockchain, a built-in DEX, and node management and diagnostics. Worked in a product team (5 backend developers, 2 frontend developers, 3 QA engineers, a project manager and a product owner): designed new features and improved existing ones based on interviews, quantitative surveys, usability tests and support requests.
- Improved the master node launch process to increase the number of independent validators and reduce the network's dependence on a small group of operators. Based on 8 interviews with CELL holders, redesigned the launch flow and the monitoring screen and tested them on a prototype with 6 holders. The share of users who opened the launch screen and went on to launch a master node **grew from 4.8% to 6.3% (+33%)**, comparing two four-week periods before and after the changes.
- **Result:** designed from scratch most of the core functionality of Dashboard, from master node management to the built-in DEX. Over 1 million transactions have gone through the product.
- Designed CFscan, the Cellframe ecosystem blockchain explorer for searching and exploring blocks, transactions, addresses and tokens, as well as validator and node data. Worked out the key scenarios and tested them with users who had different goals, from finding a transaction to exploring address and contract data. Testing showed that it was hard to find a transaction of a specific type in the general table. Added a Service type filter and a separate icon for each service type, so users could filter the operations they need and recognize them in the list at a glance.
- **Result:** the success rate of finding a transaction by type grew from 57% to 89%. After launch, 18,974 transactions went through CFscan.
- Led the design of the cross-platform KelVPN app with two modes: classic key-based connection and the NoCDB module for renting servers. Designed user flows for creating, viewing and managing orders for VPS rental paid in crypto, including the ability to set the rental duration flexibly instead of using fixed plans. Also designed the interface for server management, settings and Hybrid VPN features.
- Initiated and designed the key repurchase flow. Since keys were not renewed automatically, users received a reminder before expiry, and in the last days a discount offer was shown to those who had not yet bought a new key. The flow accounted for the key's expiry date and the user's response: first a reminder about the upcoming expiry, then an additional incentive if the reminder did not lead to a purchase.
- **Result:** the share of users with an expired key who activated a new one within 1-3 days after the previous one was deactivated grew by 16%. Compared the months before the changes with the two following months.

- Designed an internal work gamification service for a team of 40+ people. Points and a leaderboard linked task completion to the distribution of a prize fund. Worked out flows for three roles: employees reported on tasks, tracked their personal progress and recognized colleagues' contributions; managers reviewed reports and point awards; leadership managed teams, deadlines and the prize fund.
- Result: according to task tracker data, over the 6 months after launch the average time from opening to closing a task fell by 19%, and the number of completed tasks grew by 17%.
- Designed the Cellframe Shop online store from scratch: catalog, product pages, cart, user account and checkout with payment by bank card or cryptocurrency. At launch, most users who chose crypto payment did not complete their order. Conducted 10 interviews with buyers from the Telegram community who had not completed their order and had contacted support. Found that they were held back by questions about delivery of physical goods to other countries. Redesigned the crypto payment flow to remove these doubts at checkout.
- Result: in the month after the update, the checkout completion rate among users who started checkout with crypto payment grew from 24% to 63%.
- Fully redesigned the Cellframe Wallet mobile app and designed from scratch a DEX trading tab: order management, trading pair switching and order history. Tested solutions on a clickable prototype with token holders: participants completed tasks and recorded their screens, and the recordings were used to identify problem areas and refine the interface over several iterations.
- Result: full redesign of the mobile app and a new Trade tab with DEX trading functionality.
- Worked on the UX/UI of blockchain bridges and token presale forms for Web3 products. Designed user flows for transferring assets between networks, network and token selection, transaction confirmation and display of bridge operation statuses.

Product Designer | Project-based work

2019 - 2021 · Independent practice

- Designed a B2B procurement platform: customer dashboard, tender creation, bid management and supplier selection. Redesigned the bid submission and tender creation forms, increasing the completion rate by 31%.
- Built 10+ landing pages for startups. Conducted competitive analysis and user research to define page structure and key messaging.
