

Bogdan Kachatov

Senior Product Designer

[Portfolio](#)

Launched more than 10 products from scratch, including a staking platform that attracted over \$600K and a crypto wallet that processed more than 1 million transactions. I specialize in end-to-end design of complex B2B and B2C products in fintech, Web3, and SaaS. I work independently and make product decisions within existing systems while collaborating closely with product managers, developers, analysts, QA engineers, and stakeholders to build a shared product vision.

Experience

Senior Product Designer | Project-based work

2025–Present · Independent practice

- Worked on the design of an AI application under NDA that combines an AI chat with a system of personal widgets for everyday tasks and activity tracking.
- Led the design of a corporate messenger. Worked on chats, group channel management, contact lists, search, file sharing, notifications, and video calls.

Senior Product Designer | Cellframe

2022 - 2025 · Web3 / VPN / Router admin panel / Enterprise tools

Cellframe develops Layer-0 blockchain infrastructure. I was responsible for the full design cycle of products within its ecosystem, from early research to launch and post-release iterations.

Key achievements

- Led the end-to-end design of a fixed-term staking platform, from discovery to launch. Conducted user research and iteratively improved the UX and interaction design. The platform attracted over \$600K in staked tokens.
- Owned the full product design cycle for a multichain crypto wallet (desktop and mobile): wallet creation, token swaps, transaction history, an integrated DEX, and node management and diagnostics. Developed the information architecture and user flows through prototyping and close collaboration with the development team. More than 1 million transactions went through the wallet.
- Designed a router admin panel from scratch: its structure, user flows, and key device settings. Divided the interface into Basic and Advanced modes for users with different levels of technical expertise. Designed the Hybrid VPN section and related network settings, adding inline explanations for complex parameters. The product was released and put into use.

Location

Almaty, Kazakhstan

Skills

Design expertise

End-to-end product design | Interaction design | Information architecture | Design systems | Design guidelines (HIG, Material Design)

Product research

User interviews | Usability testing | CJM | JTBD | Hypothesis validation | A/B testing | Data-driven design

AI in the design process

LLM-assisted research | production-grade functional prototypes | Figma MCP

Tools

Figma | Jitter (Certified expert) | Claude code | Codex | Pencil | Midjourney

Product approach

Collaboration with product managers, developers, analysts, and stakeholders | Product decisions informed by unit economics and the Theory of Constraints.

Russian: Native

Education

Siberian State University of Geosystems and Technologies · 2019
Bachelor's degree in Information Systems and Technologies

- Led the design of the **cross-platform KelVPN application** with two modes: conventional key-based connection and server rental through the NoCDB module. Designed flows for creating, viewing, and managing crypto-paid VPS rental orders, including flexible rental periods instead of fixed plans. Also worked on server management, settings, and Hybrid VPN functionality.
- Designed the **Cellframe Shop online store**, including the catalog, product pages, cart, and account area. Designed the checkout flow with support for both card and cryptocurrency payments.
- Designed **CFscan, a blockchain explorer for the Cellframe ecosystem**, in close collaboration with the product owner. Worked on core flows: viewing blocks and transactions, address and token pages, searching by hash or address, and displaying validator and node data.
- Designed a **gamified employee motivation system with points and leaderboards**. Developed flows for three roles: employees, project managers, and leadership. Employees could submit reports, praise colleagues, report poor-quality work, and track progress on a personal dashboard. Project managers had tools to moderate reports and point awards to prevent abuse. For leadership, I designed an admin system for setting deadlines and the prize pool, managing employees and departments, and manually adding or deducting points. At the end of each period, the prize pool was distributed according to points earned.
- Worked on the UX/UI of **blockchain bridges and token presale forms** for Web3 products. Designed flows for transferring assets between networks, selecting networks and tokens, confirming transactions, and displaying bridge operation statuses.

Product Designer | Project-based work

2019 - 2021 · Independent practice

- Designed a B2B procurement platform: a customer dashboard, tender creation, application management, and supplier selection. Redesigned the application submission and tender creation forms, **increasing their completion rate by 31%**.
- Designed more than 10 landing pages for startups. Conducted competitive analysis and user research to define page structure and key messages.
